

Registration email audit

Generated 2026-09-05T05:39:03.581Z. Scope: 301 submitted registrations; 924 recipient entries, including group coordinators and members. 904 recipients belong to approved registrations; 20 to pending-review registrations.

7 addresses have problems: 4 fail application validation and 3 have domain routing issues. 917 have mail domains. A working domain does not prove that a mailbox exists or that a message reached its inbox.

Historical send status is unknown for every entry. The database has no email delivery history, and the saved Vercel token was rejected when reading production logs. Address checks reflect current saved addresses and current DNS, not evidence of past attempts. Draft registrations are excluded. No emails were sent or registration records changed.

Code findings: invalid addresses are skipped or filtered out; SMTP failures are caught and logged while approval/payment APIs still return success; submission results are returned but not persisted. No durable retry queue or delivery/bounce tracking was found. Group messages run concurrently; one rejected promise allows the helper to return before remaining messages finish, creating a potential serverless lifecycle risk, not a confirmed cause for these applicants.

Next steps: confirm the seven addresses with applicants, obtain provider send/bounce logs and restore Vercel log access, then record each email attempt with recipient, event, timestamp, SMTP acceptance/rejection, message ID and error. SMTP acceptance should be shown separately from confirmed delivery.
